

Ian Salandy

Staff Software Engineer — Distributed Systems & Performance Engineering

Atlanta, GA | ihsaland@gmail.com | github.com/ihsaland | linkedin.com/in/isalandy

SUMMARY

Staff-level software engineer with 15+ years of experience designing, scaling, and optimizing distributed systems and data platforms. Expertise in high-throughput event processing, backend infrastructure, and performance engineering for systems operating at multi-billion event scale. Proven ability to identify bottlenecks, improve system efficiency, and influence architecture across teams. Strong track record of driving reliability, scalability, and cost optimization through data-driven engineering.

CORE TECHNICAL STRENGTHS

Distributed Systems & Backend Architecture
Large-Scale Data Platforms (Spark, Trino, Kafka)
Performance Engineering & Bottleneck Analysis
Scalability, Reliability & System Design
Capacity Planning & Workload Modeling
Observability, Telemetry & Diagnostics
Cloud Infrastructure (AWS, Kubernetes, EMR, EKS)
JVM Performance & Memory Optimization

PROFESSIONAL EXPERIENCE

Salesforce — Staff Performance Engineer / Acting Principal Architect (2021 – Present)

- Led performance optimization of distributed data platforms processing billions of events annually.
- Improved system throughput by 35% and reduced infrastructure cost by 25%.
- Designed large-scale data processing systems using Spark and Trino.
- Built workload modeling frameworks to forecast scaling limits.
- Developed telemetry-driven diagnostics to identify bottlenecks.
- Influenced architectural decisions across teams.

IBM — Principal Performance & Capacity Engineer (2016 – 2021)

- Designed performance engineering frameworks for distributed platforms.
- Built predictive scaling models for system capacity.
- Optimized JVM-based systems improving latency and stability.
- Developed profiling tools for performance regressions.

Accenture — Lead Performance Engineer (2009 – 2016)

- Led performance engineering initiatives for distributed systems.
- Designed load testing frameworks for high concurrency.
- Diagnosed and resolved performance issues in production.

SELECTED IMPACT

- Improved distributed system throughput by 35%
- Reduced infrastructure cost by \$750K+ annually
- Enabled processing of billions of events

- Improved scalability through system optimization

TECHNOLOGIES

Java, Python, SQL

Spark, Trino/Presto, Kafka

Kubernetes, AWS, EMR, EKS

Distributed systems design, workload modeling, performance optimization

EDUCATION

M.S. Computer Science — North Carolina State University

B.S. Computer Science — Morehouse College
